AI acknowledgement coversheet

Name: Kaike Nehme · **Student number:** s4959287
Course: DECO7230 — Digital Prototyping and Extended Reality
Assignment: Interactive Prototype 2b (Fri 23 Oct 2026, Week 12 Studio)

☑ **Yes, AI tools have been used to generate or edit material in this assessment.**

AI use in IP2b was Claude Code (Anthropic, model Claude Opus 5.5), driven interactively by Kaike Nehme in supervised terminal sessions, with Blender driven by Claude through the MCP for Blender add-on for the room mock-ups; and, once, Claude Sonnet 5.5 (Anthropic) to paraphrase my own rewrite of the research paragraph. No generative image or 3D model was used. Prompts were conversational: the "Prompt(s)" column summarises the direction given, quoting my words where the running log recorded them. The raw log kept during development is `ip2b/ai-use-log.md` (committed with full history). IP2b builds on the IP1 and IP2a Unity code, whose AI use was declared with those submissions (Claude Fable 5 and Fable 5.1). Furniture models and textures are human-made assets (Sketchfab CC-BY / Free Standard, Poly Haven and ambientCG CC0), credited in `ip2b/RenovationPreviewer/Assets/Catalogue/CREDITS.md`.

Tool	Use	Prompt(s)	Section	Date
Claude Code (Claude Opus 5.5)	Reading the brief: listed the IP2b deliverables from the task sheet, rubric and Week 6 slides (five principles, questionnaires) and flagged the simulator grade cap	Asked what IP2b needs; supplied the Week 6 slides	— (chat)	17 Oct 2026
Claude Code (Claude Opus 5.5)	Design ideation and references: brainstormed the IP2b direction with me, searched the web for contemporary living-room references and built a moodboard; searched Sketchfab and Poly Haven for free furniture	My choices: references A + F, nothing stays, walls + floor + furniture, a mid-century bedroom, keep the IP2a features, curtains that darken the room	`ip2b/art/`	17 Oct 2026
Claude Code + Blender (MCP)	Room mock-ups: assembled and rendered the living room and bedroom in Blender, recoloured the bedroom pieces	My review: "furniture stuck in the middle", "add a TV"	`ip2b/art/*.png`	17 Oct 2026
Claude Code (Claude Opus 5.5)	Planning: wrote the design specs and build plans from my decisions, including the Empty room that replaced MR	Approved each spec and plan; Empty room: "as free as possible to create something they are imagining"	`docs/superpowers/specs/`, `docs/superpowers/plans/`	17–20 Oct 2026
Claude Code (Claude Opus 5.5)	Code generation: all new C# for IP2b with EditMode/PlayMode tests — pull from any surface, fan deck, floor tint, toss, curtains, Living and Bedroom presets, Empty room; the MR showcase was built, then removed; furniture models decimated in Blender for the Quest	Approved the build plans and asked for them to be built	`ip2b/RenovationPreviewer/Assets/`	17–20 Oct 2026
Claude Code (Claude Opus 5.5)	Debugging: traced the MR "fall into the void" bug I found on my desktop lap (the rig's gravity kept running with the floor hidden)	Reported the bug from my lap; I decided to cut MR	— (diagnosis)	19 Oct 2026
Claude Code (Claude Opus 5.5)	Research: found 7 academic sources, verified each through Crossref, and drafted the research paragraph	Asked for sources tied to hold-up, toss, colour in VR, the Empty room and the questionnaires. I then rewrote the paragraph in my own words (next row).	`ip2b/research-references.md`, testing plan	17–20 Oct 2026
Claude Sonnet 5.5 (Anthropic)	Editing: paraphrased my own rewrite of the research paragraph for readability (shorter sentences, reason first)	I wrote my own version of the paragraph and asked it to paraphrase my wording	Testing plan — research summary	23 Oct 2026

Tool	Use	Prompt(s)	Section	Date
Claude Code (Claude Opus 5.5)	Test-day morning: walked me through my desktop lap; after my findings, wrote the window fix (no glass reflection, grass texture outside, a glass blend bug in the scene builder) and re-ran the tests; added a B3 step-back observation and overview question to the testing plan; on my question about recording, added the app's event log (hold-up / toss commits) to the recording script; checked the brief against the repo and wrote the script that turns the logger export into the results tables (no results yet); plan wording: grip = let go, 8-minute session justified	My lap findings: "you need to get too close to the wall… you don't have the feeling of how that wall looks on the overall room"; "the window reflects the light from the ceiling pendant… could we make it like a grass floor outside"; I chose a test question over a code change for hold-up	`Assets/Editor/SceneBuilder.cs`, testing plan, `ip2b/record-session.sh`, `testing-data/ip2b/build-results.py`	23 Oct 2026
Claude Code (Claude Opus 5.5)	Studio and results: troubleshot the headset connection and installed the app; after the session exported the logger records, generated the raw results tables, wrote the data-quality notes, and wrote the five-principles verdicts from what I observed	"can you save the login on the app?"; my observations: "nobody squinted, no sickness, some got stuck holding the ball"	`testing-data/ip2b/`	23 Oct 2026
Claude Code (Claude Opus 5.5)	Documents: drafted the testing plan (B1–B6, five principles, UEQ-S + VRSQ), the iPad session logger, this coversheet and the PDFs; test-day checks	Asked for a plan another person could run; "make sure everything is on point for tomorrow"	`ip2b/*.md`, `ip2b/*.pdf`, `ip2b/ipad-logger.html`	17–23 Oct 2026
Claude Code (Claude Opus 5.5)	Tooling and builds: headless test runs, Android APK builds for the Quest	Asked for a build-only check (20 Oct) and the test-day build	project config, `Builds/`	20–23 Oct 2026

Not AI: the concept and every design decision (nothing stays, the two rooms, cutting MR, the Empty room), the desktop lap and its findings on 23 Oct, running all in-class testing on 23 Oct and the observations behind the five-principles verdicts, and the analysis of the results (Evaluation 3).
