

Statement of Originality

DECO7230 — Digital Prototyping and Extended Reality · Interactive Prototype 1 · Kaike Nehme · [student number] · Fri 28 Aug 2026

The design of this prototype is my own work: the concept (an XR renovation previewer anchored to the surfaces being kept), the core interaction loop (mark, pull, hold, tune, commit), the decision to constrain colour options to what harmonises with kept surfaces, the diegetic no-menus rule, the scope decisions across the three prototypes, and the testing plan's objectives and protocol were developed by me across Weeks 1–3, documented with revision history in `concept/2026-08-07-xr-renovation-concept-design.md` and iterated through Week 2 studio peer feedback.

AI tooling (Claude Code, Anthropic) was used, with my direction and review, for implementation scaffolding of the Unity project: project configuration scripts, the C# implementations of the architecture I specified in the concept document (§8), automated tests, and document formatting. Every AI contribution is itemised in the accompanying AI acknowledgement table (`ip1/ai-acknowledgement.md`), kept as a running log during development per UQ Library guidance.

All third-party assets are limited to Unity's official packages (URP, XR Interaction Toolkit, OpenXR plugin, Input System) and their bundled starter samples, used under Unity's licence, plus CC0 textures (Poly Haven, ambientCG) and publicly available Dulux colour values recorded in the AI acknowledgement. No other code, assets, or text were sourced externally.

The in-class testing, data collection, and all analysis are my own work.
